## **1. Introduction**

1. This assessment is based on the expenditure data presented in the 2020-21 Budget and fulfils the statutory requirement under Section 94 of the Climate Change (Scotland) Act 2009 to report upon the emissions impact of expenditure proposals.

### **1.1. Scope of Assessment**

2. The assessment of the Budget captures the emissions associated with the Scottish Government's purchase of goods and services. It is a consumption-based measure that covers direct emissions (e.g. the production of gravel for roads constructed by the Government or generation of electricity used by Government) and also any imported emissions that are generated in producing the direct and indirect goods and services that the Government purchases.
3. The methodology for the Carbon Assessment of the Budget is high level in nature. This assessment allows the Scottish Government to place the carbon impact of its use of goods and services within the wider context of the national and global economy. It helps raise awareness of the carbon impact of spend in different areas, by identifying direct emissions and those from supply-side inputs.
4. The assessment does not take account of 'second-round' emissions. While we do include emission impacts associated with Government spend and its supply chain, we do not count the emissions or savings associated with all of the outcomes arising from this spending. For example, while the Carbon Assessment could include an estimate of the carbon associated with the cost of constructing a road, the carbon associated with the subsequent use of the road is not included.
5. The Scottish Government uses a range of other tools, during the policy development stage, to quantify emissions impacts over the policy/project lifetime. These tools include Strategic Environmental Assessments. The Environmental Assessment (Scotland) Act 2005 requires that every qualifying public plan, programme and strategy is considered for its likely environmental effects and, where likely to be significant, opportunities to avoid adverse impacts are sought and positive ones enhanced. Results are published in the Environmental Reports within the Strategic Environmental Assessment database: <https://www2.gov.scot/seag/publicsearch.aspx>
6. Further tools include Environmental Statements, which are required to assess the environmental effects of certain public and private projects under the Roads (Scotland) Act 1984 (Environmental Impact Assessment) Regulations 2017, which update the requirements in the Roads (Scotland) Act 1984. The Carbon Account for Transport also provides a balance sheet for Scotland's greenhouse gas emissions, and the expected emissions impacts of major transport infrastructure projects and regulatory measures. The latest Transport Carbon

Account is available at the following link:

<https://www.transport.gov.scot/media/43477/sct10188088981.pdf>.

7. The combined effect of Scottish Government policies to reduce emissions over the period to 2032 is set out in the Climate Change Plan, published in February 2018. Last year, Scotland set world-leading climate change legislation in the Climate Change (Emissions Reduction Targets) Scotland Act 2019, with a target date for net-zero emissions of all greenhouse gases by 2045, ending our contribution to climate change. This year, we are updating our Climate Change Plan to reflect these new targets
8. Although the methodology underpinning the Carbon Assessment of the Budget remains the same as for the Carbon Assessment of the 2019-20 Budget, the base year of Environmental Input-Output (EIO) model itself has been updated from 2014 to 2015. This is possible because of the newly available input-output analytical tables covering the year 2015 for the UK. As usual the model has also been updated to use the latest available Greenhouse Gas emissions ratios and HM Treasury deflators. More information about these changes and their effects on the overall GHG estimates can be found in Annex A.

## **1.2. Key Results**

9. Following the approach set out in section 1.1, it is estimated that total emissions attributed to the 2020-21 Budget amount to 9.5 million tonnes carbon dioxide equivalent (MtCO<sub>2</sub>e). Applying the updated model to last year's 2019-20 Budget leads to a downward revision to the published 7.3 MtCO<sub>2</sub>e to 7.0 MtCO<sub>2</sub>-equivalent.
10. This increase is almost entirely because EU Common Agricultural Payments and UK Social Security payments have moved over to the Scottish Budget. As a result, the greenhouse gas emissions associated with Scottish Government spending have also increased.
11. Details on the various sources of emissions show that some 29 per cent of the Scottish Government's carbon footprint is caused by the use of Energy, Water and Waste, followed by Manufacturing (21 per cent) and Agriculture, Forestry and Fishing (17 per cent).
12. It is estimated that total emissions attributed to capital investment plans of £5.8 billion of investment in 2020/21 amount to 1.2 MtCO<sub>2</sub>e. Note this is activity relating to putting the capital investment in place and not its long term use. Emissions associated with resource spend amount to 8.3 MtCO<sub>2</sub>e.

## **1.3. Budget Context**

13. Budget for 2020-21 contains details of Total Managed Expenditure (TME) of £49.3 billion across portfolio areas. Expenditure is split between resources and capital expenditure, and Annually Managed Expenditure (AME). This is illustrated in Table 1. Total Managed Expenditure was £42.5 billion across portfolio areas in the 2019-20 Draft Budget.

**Table 1: Total proposed spending plans for 2020-21**

2020-21 Budget	Resource	Capital	Financial Transactions	Total	UK Funded AME	Total
	£m	£m	£m	£m	£m	£m
Health and Sport	14,805.5	428.0	10.0	15,243.5	100.4	15,343.9

## Summary

It is estimated that total emissions resulting from the 2020-21 Budget will be 9.5 Mt CO<sub>2</sub>-equivalent.

This has increased since the 2019/20 Budget almost entirely because EU Common Agricultural Payments and UK Social Security payments have moved over to the Scottish Budget. As a result, the greenhouse gas emissions associated with Scottish Government spending have also increased.

Emissions remain broadly proportional to spend, except for Rural Economy, where emissions per unit of spend are higher.

'Second-round' emissions that may result from Government spending and the use of public goods and services, whether beneficial in terms of reducing emissions (e.g. spending on energy efficiency or afforestation) or negative in terms of increasing emissions (e.g. road use) are not captured.

Alongside this analysis of the carbon impact of the Budget, the Scottish Government will continue to use individual level assessments to improve understanding of the lifecycle emission impacts of Government projects and policies. The Scottish Government's Climate Change Plan, published in February 2018, lays out further information on the measures that will allow us to meet our climate change targets out to 2032. Last year, Scotland set world-leading climate change legislation in the Climate Change (Emissions Reduction Targets) Scotland Act 2019, with a target for net-zero emissions of all greenhouse gases by 2045, ending our contribution to climate change. This year, we are updating our Climate Change Plan to reflect these new targets.

## 2. High-level Carbon Assessment of 2020-21 Budget

### 2.1. Portfolio Expenditure and Associated Emissions

14. Total estimated emissions attributable to the 2020-21 Budget are 9.5 Mt CO<sub>2</sub>-equivalent. Table 2 shows overall spend and emissions by the individual portfolios and further, how these emissions arise. Emissions remain broadly proportional to spend, except for Rural Economy, Transport, Infrastructure and Connectivity and Social Security and Older People, where emissions per unit of spend are slightly higher. Health and Sport, Communities and Local Government, Rural Economy, Transport, Infrastructure and Connectivity and Social Security and Older People are the largest Budget items, with the highest emissions.

15. Expenditure is shown net of income, in line with the Budget, and emissions are calculated on that basis.<sup>1</sup>

**Table 2: Portfolio expenditure<sup>2</sup> (TME excluding non-cash items) and emissions**

Portfolio	Spend £m	Estimated GHG emissions (thousands of tonnes of CO <sub>2</sub> equivalent)			Total	
		Domestic				
		Direct	Indirect	Imported		
Health and Sport	£14,970	375.4	586.5	963.6	1,925.4	
Communities and Local Government	£11,323	645.2	408.8	1,077.7	2,131.6	
Finance, Economy and Fair Work	£6,241	20.9	235.8	585.1	841.7	
Education and Skills	£4,126	102.3	110.5	362.3	575.1	
Justice	£2,774	80.4	105.6	221.5	407.6	
Transport, Infrastructure and Connectivity	£3,325	377.9	106.1	596.8	1,080.8	
Environment, Climate Change and Land Reform	£435	7.5	11.5	70.9	89.9	
Rural Economy	£745	967.3	142.6	164.1	1,274.1	
Culture, Tourism and External Affairs	£349	7.9	16.7	23.8	48.4	
Social Security and Older People	£3,788	223.5	141.4	705.4	1,070.2	
Government Business and Constitutional Relations	£16	0.5	0.6	1.3	2.4	
Crown Office and Procurator Fiscal Service	£129	4.0	5.1	10.4	19.5	
Scottish Parliament and Audit Scotland	£103	3.1	3.9	7.7	14.7	
<b>Total</b>	<b>£48,323</b>	<b>2,816.0</b>	<b>1,875.1</b>	<b>4,790.4</b>	<b>9,481.4</b>	

16. Direct emissions account for 30 per cent of the total; indirect emissions for a further 20 per cent – a large proportion of which is caused by electricity generation. 51 per cent of emissions attributable to Budget expenditure are generated outside Scotland and are embedded in imported goods and services.

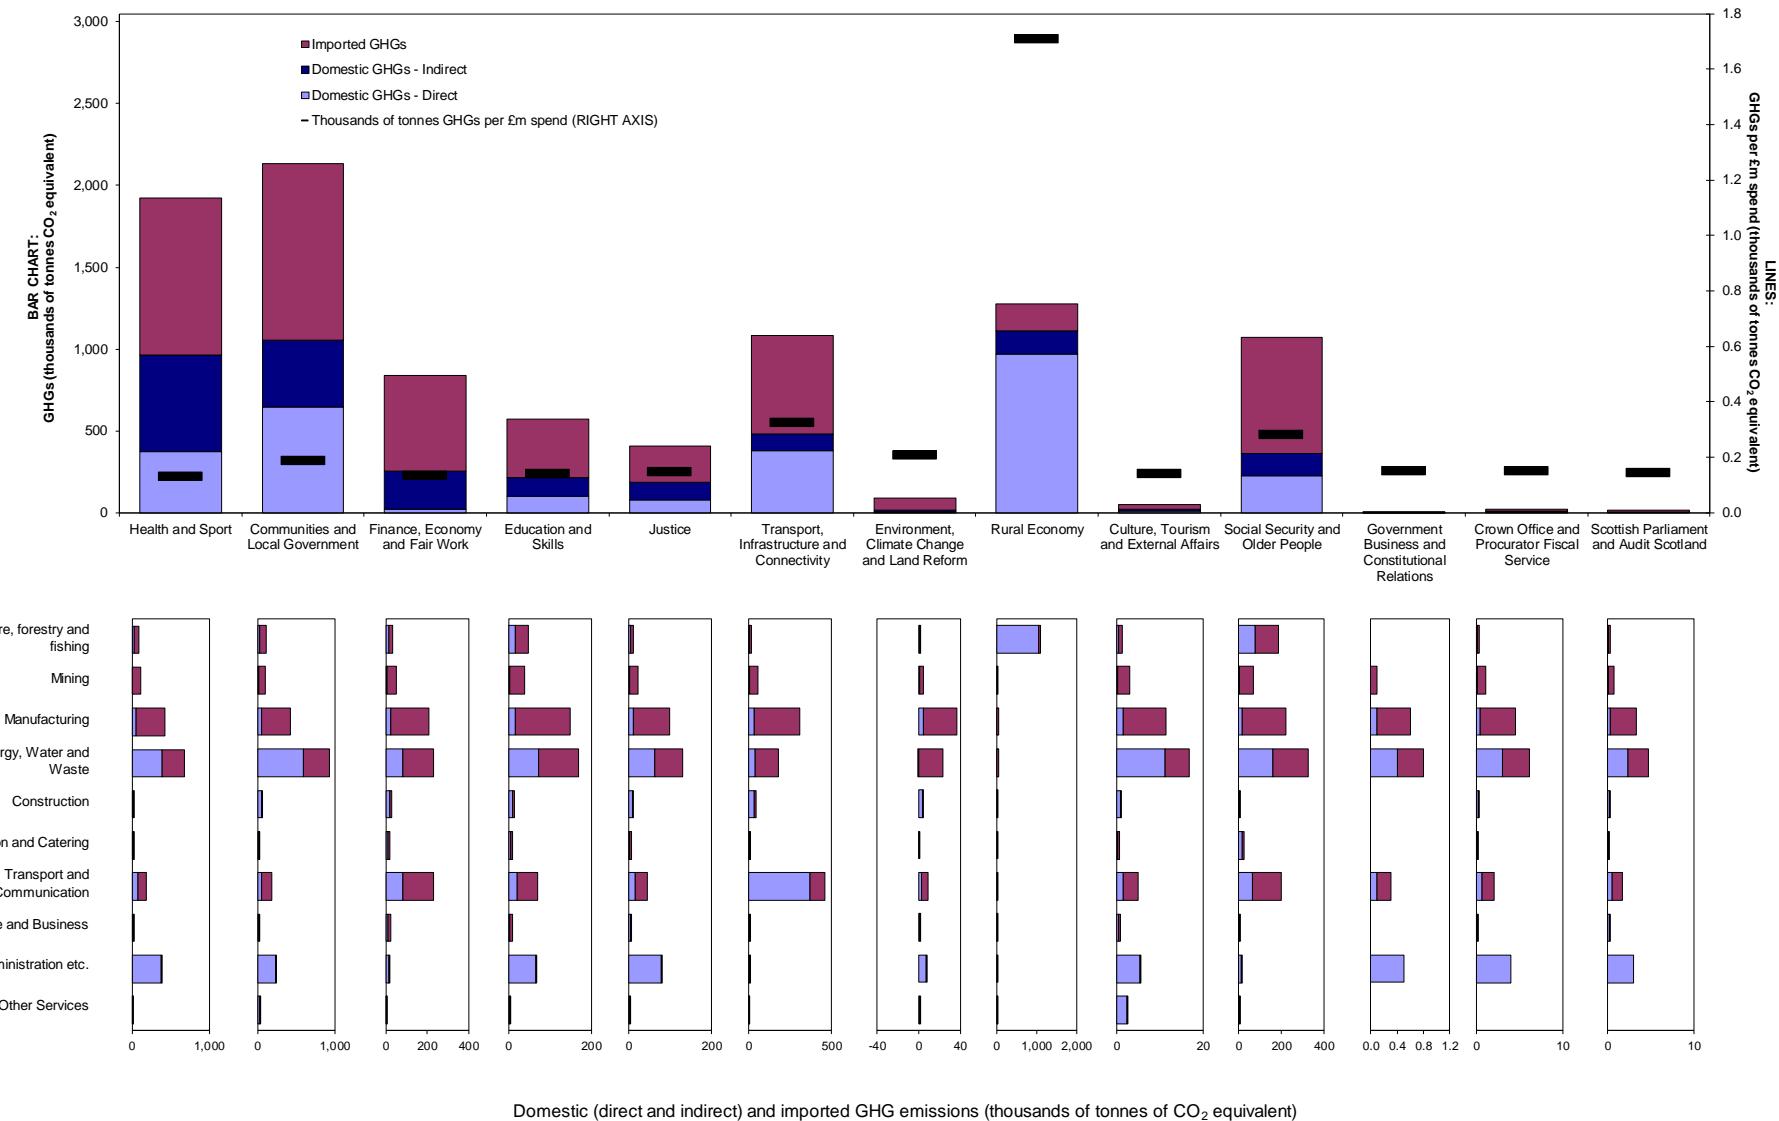

17. Figure 1 demonstrates graphically the results for individual portfolios and the split by type of emissions (direct/indirect), and also whether the emissions are domestic or imported. As the graph highlights, the emissions intensity (carbon emissions per pound of spend) of individual portfolios are broadly similar. The exception is Rural Economy, where the emissions intensity of spend is higher.

<sup>1</sup> See Annex B for a fuller discussion of this issue.

<sup>2</sup> Non-cash items are excluded from the assessment where they do not lead to extra demand for goods and services. Because these items are excluded, the Budget total shown here is lower than that in the Budget itself, and lower than in Table 1.

18. A large part of this expenditure is linked to carbon-intensive production methods (carbon sequestration through forestry is not taken into account. Note that in the second part of Figure 1, the scales vary by portfolio.

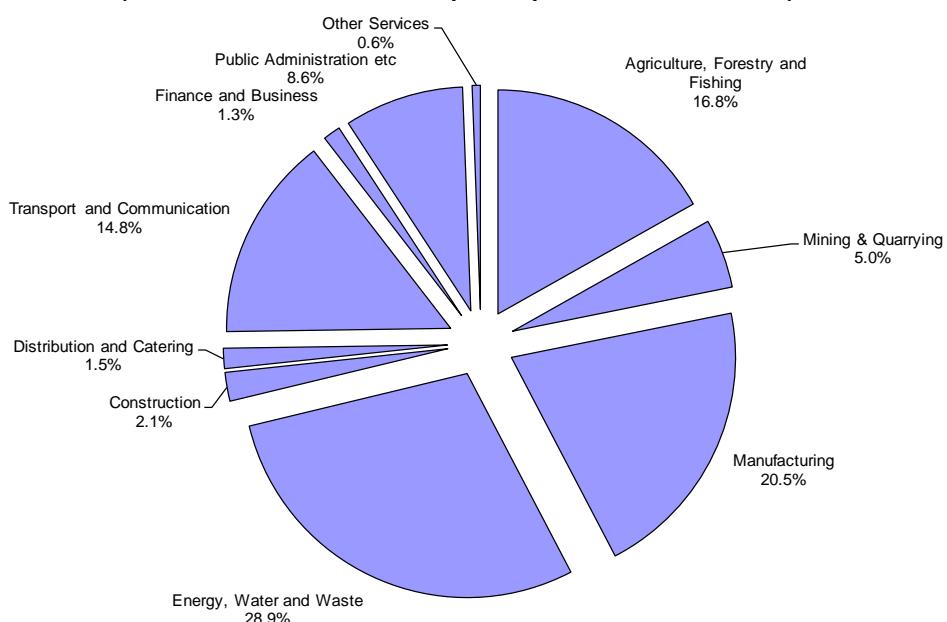

**Figure 1: Estimated domestic and imported GHG emissions (thousands of tonnes of CO<sub>2</sub> equivalent) by portfolio and generating industry.**  
**Scottish Government Budget 2020/21**

## 2.2. Emissions by Industry Source

19. Figure 1 confirms the continued importance of domestic energy production and its emissions across the Scottish Budget. In addition to this, for Rural Economy, the support of farming activity leads to significant levels of methane and nitrous oxide emissions.<sup>3</sup>
20. Total emissions broken down by industry are shown in Figure 2. Some 29 per cent of the Scottish Government's carbon footprint is caused by the use of Energy, Water and Waste, followed by Manufacturing (21 per cent) and Agriculture Forestry and Fishing (17 per cent).

**Figure 2: Overall Government spending - Industry sector share of emissions  
(domestic direct and indirect, plus imported GHG emissions)**

21. To reduce the emissions from Government spending, decarbonisation of the energy sector remains an important policy aim. As the sector is decarbonised, the carbon intensity of the sector in the Environment Input-Output model will fall, with a consequential reduction in carbon emissions recorded in the use of electricity<sup>4</sup>.

<sup>3</sup> This methodology excludes impacts upon carbon dioxide from affecting soils – e.g. ploughing, planting, woodland sequestration. The carbon footprint for the Rural Economy portfolio does not include the emissions relating to spending financed by EU funds because the Budget only shows net expenditure i.e. expenditure that is not funded through sources of income like EU funds.

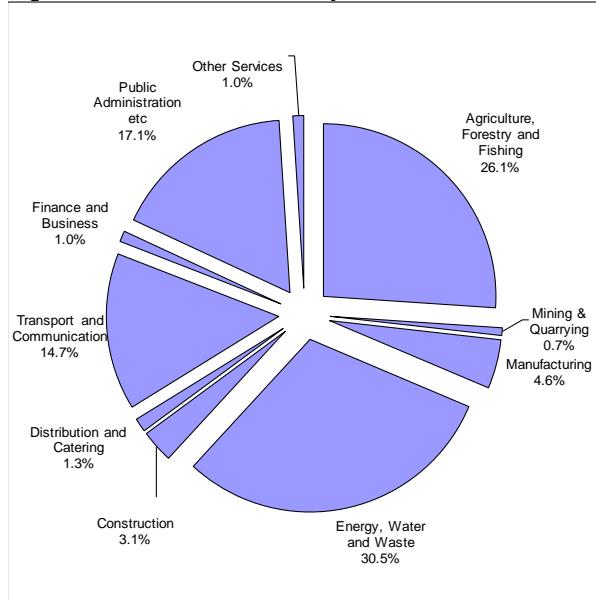

<sup>4</sup> This assessment does not take into account the impact of the EU Emissions Trading Scheme (EU ETS).

### **2.3. Domestic and Imported Emissions**

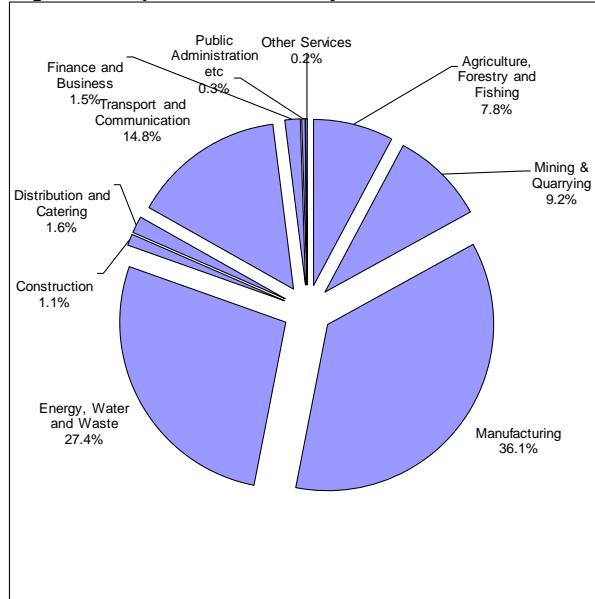

22. In addition to direct and indirect domestic emissions, the assessment takes into account the emissions generated outside of Scotland in the production of imported goods purchased as a result of Government spending (e.g. food, machinery, IT equipment).
23. Figure 3 demonstrates that imported emissions make up around a half of emissions from Budget spend. There is however a difference between the sources of domestic and imported emissions. Expenditure on Energy, Water and Waste accounts for the largest share of domestic emissions, while expenditure on Manufacturing generates the largest share of imported emissions (followed by Energy, Water and Waste).

**Figure 3: Domestic and Imported Emissions - All portfolios**

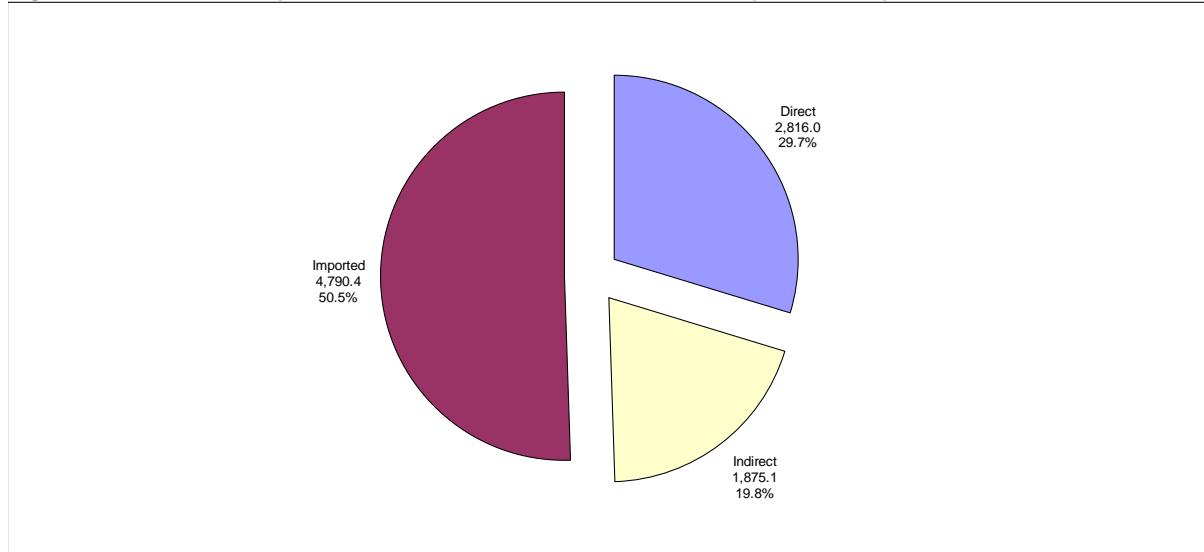

**Figure 3a: Domestic emissions by industrial sector**

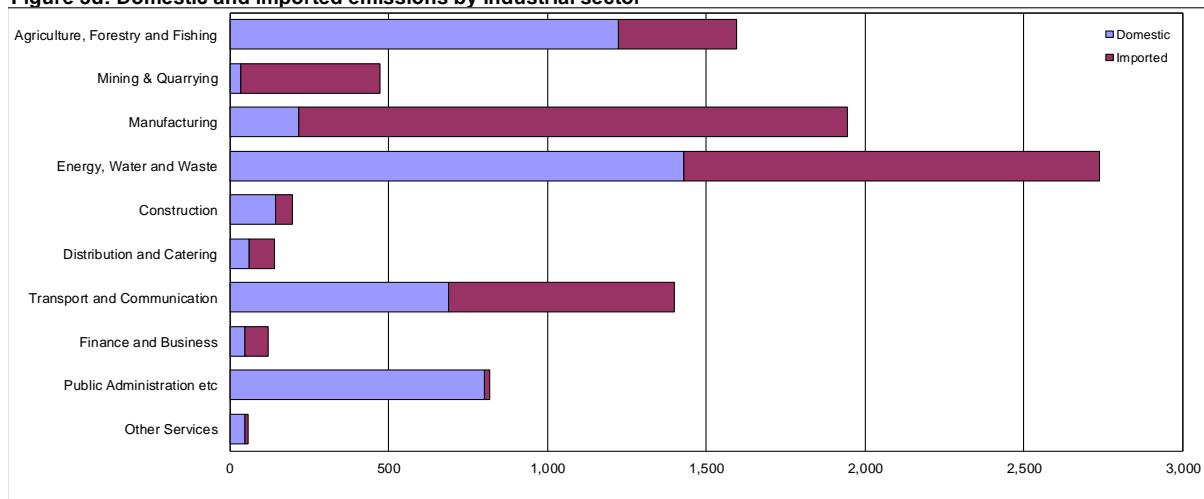

**Figure 3b: Imported emissions by industrial sector**

**Figure 3c: Domestic and imported emissions, thousands of tonnes of CO<sub>2</sub> equivalent and percent**

**Figure 3d: Domestic and imported emissions by industrial sector**

## **Annex A – Methodology**

1. The figures presented in this report are estimated using the Scottish Government Environmental Input-Output Model (EIO) 2015.
2. The EIO is constructed using the Scottish Government Input-Output Tables 2015 (taken from the 1998-2016 Tables published in July 2019), UK Blue Book 2018 consistent Input-Output Tables 2015 and UK Analytical Tables 2015, UK Environmental Accounts 2015 (June 2019) and HM Treasury GDP Deflators, December 2019.
3. A fuller description of the model and its associated Greenhouse Gas effects estimates that this assessment is based upon can be found at:  
<https://www.gov.scot/publications/about-supply-use-input-output-tables/pages/environmental-input-output/>

## **Rewvisions to the Environmental Input-Output Model**

4. With the release of new Input-Output Analytical Tables covering the year 2015 for the UK, this year the base year of the EIO model has been updated from 2014 to 2015. This has involved a number of additional changes to the model:
  - The updating of the underlying Scottish Input-Output model and UK closed economy input-output model from the 2014 version to the latest published version for 2015
  - The updating of the year used to calculate emissions factors from 2014 to 2015alongside the regular annual updates of:
  - Updating the emissions data from ONS environmental accounts to the latest published version
  - Updating the forecast GDP deflator used to project estimates to the budget year to the latest version published by HMT.
5. These changes have led to a downward revision to estimated greenhouse gas emissions arising from the 2019-20 Draft Budget of around 3%.
6. The majority of this revision arises from the updating of the UK Input-Output Tables from the old 2014 version to the 2015 version in the closed economy model.
7. Other sources of revision include changes in the GHG emissions factors between 2014 (the year for which the old model was constructed) and 2015 (the year for which the new model was constructed), changes in the underlying Scottish Tables between the old 2014 versions and the 2015, revisions to the forecast GDP deflator, and price changes between 2014 and 2015 which were not well approximated by the change in the GDP deflator.
8. Care should be taken when interpreting the revision to imported GHGs. Given the lack of a world economy model and emissions factors, the EIO model uses the UK economy as a proxy for the world economy. Changes in emissions intensities in the UK economy may not be representative of changes in the world economy, for example due to different technologies being used, or if more carbon intensive activities move overseas and are replaced by imports.

## **Annex B - Detailed Tables**

1. The tables below show the detail of the Carbon Assessment down to Level 3 spending lines, including some income lines (such as EU income). Since the Budget is calculated in terms of net expenditure, the carbon assessment of the Budget has been calculated on the same basis. For some portfolios, the Level 3 spending lines already have income netted out whereas others show gross expenditure. Where figures are not already expressed as net it is necessary to show a negative carbon number against the income lines. At Level 2 and at portfolio level, the income is fully netted off and there are no discrepancies between portfolios, making spending lines directly comparable.
2. Some non-cash items are not considered for the purposes of this analysis. Because these items are excluded, the Budget total shown here is lower than that in the Budget itself.
3. The Scottish Budget also creates private incomes (both in the public sector and in the private industries whose goods and services are demanded by Government). The Scottish Budget thus *induces* demand and further economic output, which generates carbon emissions. There are arguments for including or excluding this expenditure from the calculation and our calculation excludes emissions from induced demand.

Note: Spend lines are shown in £m and exclude non-cash items  
Emissions are shown in thousands of tonnes of CO<sub>2</sub>-equivalent  
0.0 denotes less than £0.05m or 0.05 thousand tonnes
